

TRABAJO PRÁCTICO FINAL

Ecosistema de Automatización IA — Gestión de Facturas de Proveedores

Campo	Detalle
Caso	Circuito de facturas de proveedores de una empresa constructora. Es el mismo proceso que vengo trabajando desde la Pre-Entrega 1.
Orquestador	Make.com
Base de datos	Notion, con tres tablas relacionadas
Procesamiento IA	OpenAI · gpt-4o-mini
Canales de salida	Slack y Gmail
Estado	Construido, probado y activado

Qué hace el sistema

Llega una factura de un proveedor. El sistema valida que esté completa, busca la ficha comercial de ese proveedor en otra tabla, y le pasa las dos cosas juntas a la IA para que analice el riesgo y le asigne una prioridad. Después avisa al equipo por Slack y se detiene.

Ahí frena. No autoriza nada. Espera a que una persona lea el análisis y tilde un checkbox. Recién cuando eso pasa, el sistema confirma la autorización, avisa a Tesorería y cierra el circuito.

La decisión de pagar no está en ningún módulo. Está en una persona.

1. Mapa de arquitectura

El escenario tiene un trigger, un Router con tres rutas y una rama de manejo de errores. Las tres rutas son excluyentes: una factura entra a una sola.

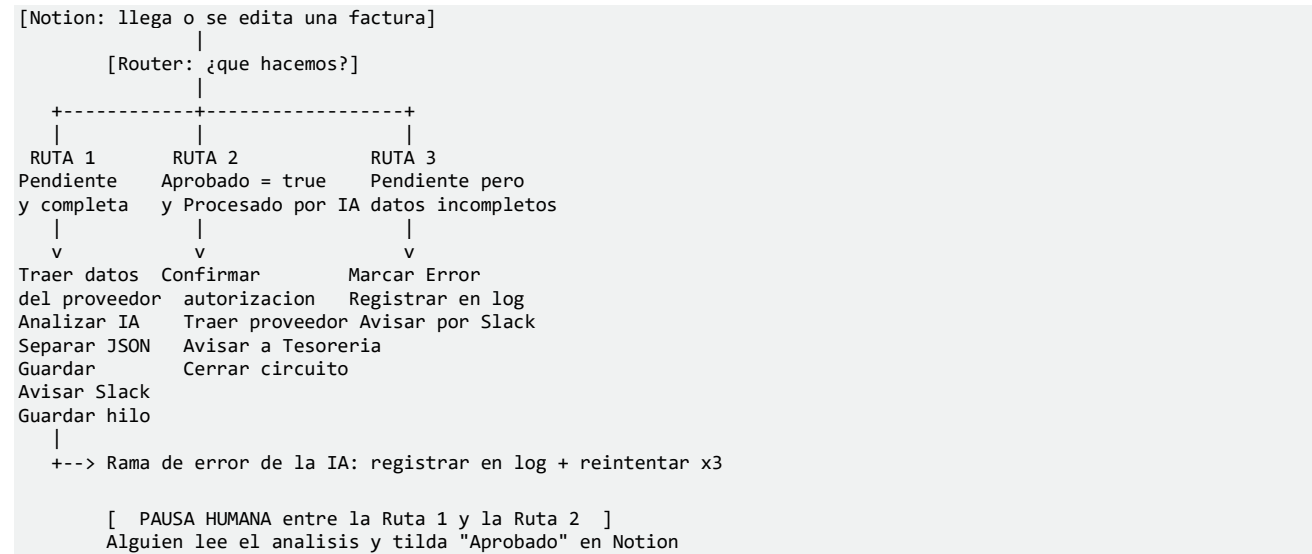

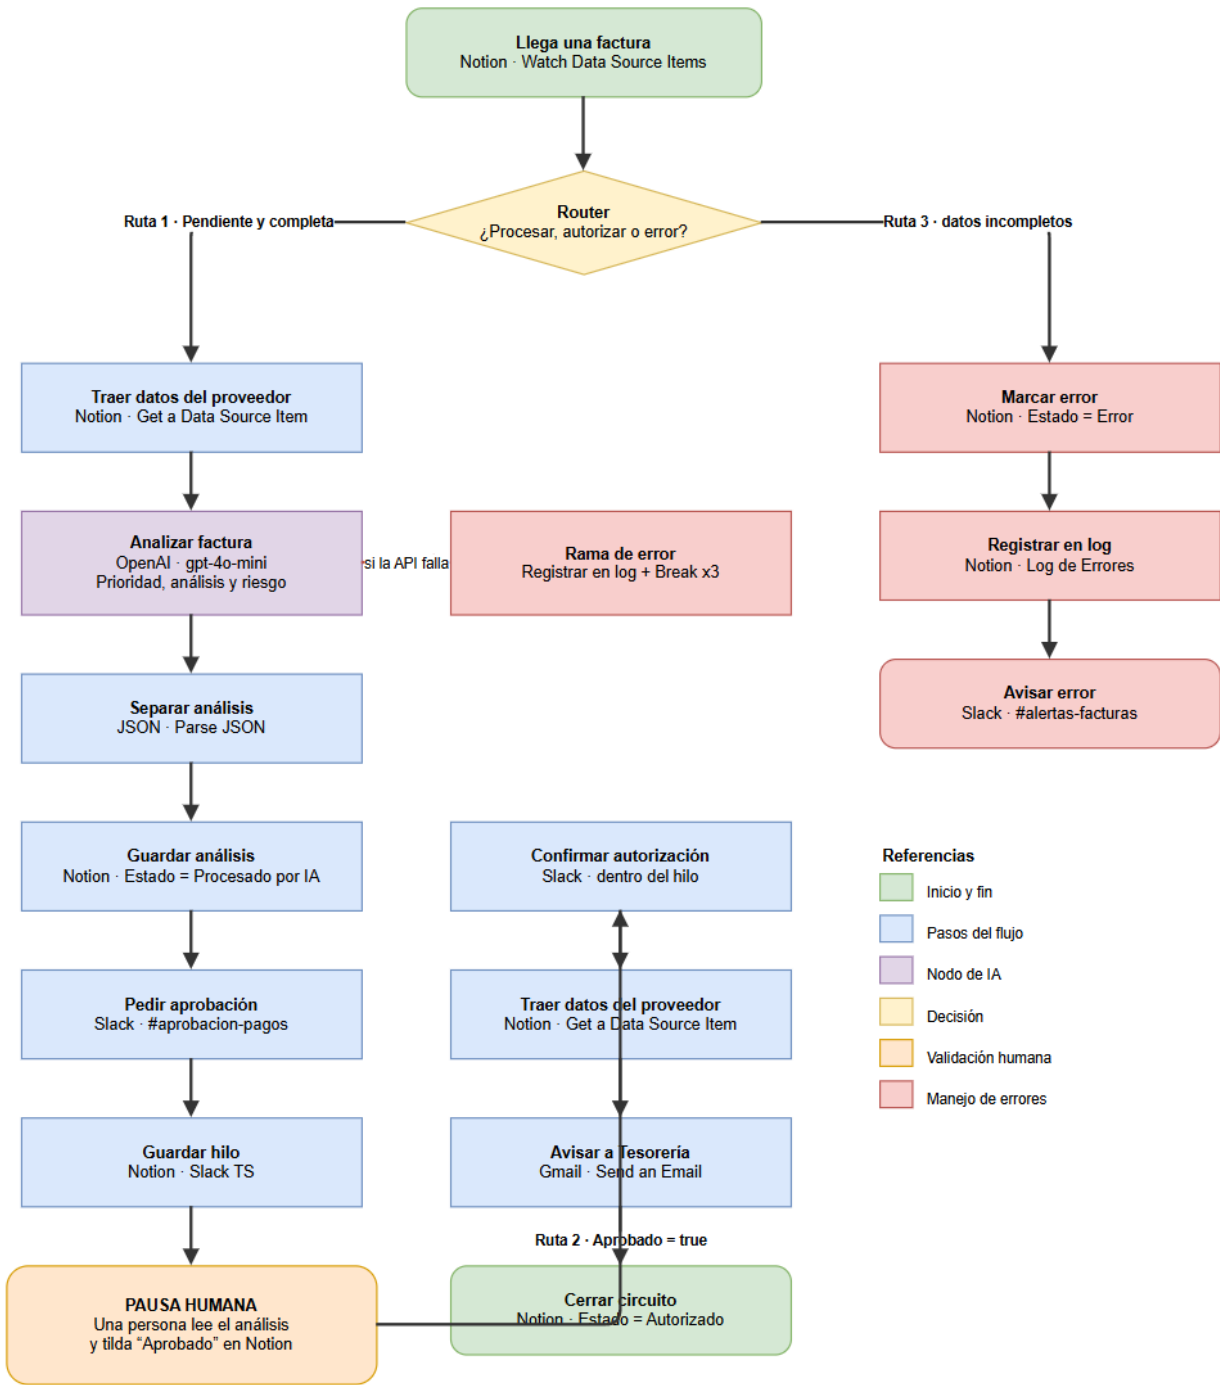

Diagrama de arquitectura

Diagrama armado en draw.io con el flujo completo: trigger, router, nodo de IA, rutas de salida, rama de error y punto de validación humana.

Arquitectura del ecosistema de gestión de facturas de proveedores

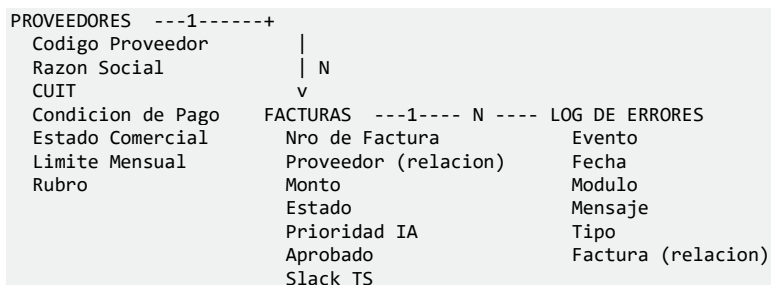

Los módulos

Módulo	Ruta	Qué hace
Factura modificada Notion · Watch Data Source Items	Trigger	Detecta cuando se crea o edita una factura. Limit en 3 para no gastar operaciones de más.
¿Procesar, autorizar o error? Router	—	Abre las tres rutas.
Conseguir datos de Proveedores Notion · Get a Data Source Item	1	Sigue la relación y trae la ficha comercial del proveedor.
Analizar Factura IA OpenAI · gpt-4o-mini	1	Cruza los datos de la factura con los del proveedor y devuelve prioridad, análisis y riesgo.
Registrar fallo de IA + Retry Break · 3 reintentos	Error	Si OpenAI falla, deja el registro en el log y reintenta 3 veces cada 15 minutos.
Separar Analisis JSON · Parse JSON	1	Separa la respuesta de la IA en tres variables.
Guardar analisis Notion · Update	1	Escribe el análisis en la factura y pasa el Estado a Procesado por IA.
Pedir Aprobación Slack · Create a Message	1	Publica el análisis en el canal con el link a Notion.
Guardar hilo Slack Notion · Update	1	Guarda el ID del mensaje de Slack para poder responder en el mismo hilo.
Confirmar autorizacion Slack · Create a Message	2	Publica la autorización dentro del hilo original.
Notificar a Tesoreria Gmail · Send an Email	2	Manda el detalle completo al área que ejecuta el pago.
Cerrar circuito Notion · Update	2	Pasa el Estado a Autorizado y registra la fecha.
Marcar error / Registrar en log / Avisar error	3	Marca la factura, deja el registro y avisa por Slack.

2. Estructuras de datos

2.1 Las tres tablas y cómo se relacionan

La relación entre Facturas y Proveedores no está de adorno. Es lo que le permite a la IA saber que un proveedor está suspendido o que el monto de la factura supera el límite mensual que se le asignó. Sin esa relación, la IA solo vería la factura suelta y no podría detectar ninguno de esos dos riesgos.

2.2 Las columnas de Facturas

Columna	Tipo	Quién la completa
Nro de Factura	Título	Carga manual
Proveedor	Relación → Proveedores	Carga manual
Monto / Moneda	Número / Selección	Carga manual
Fecha Recepcion / Fecha Vencimiento	Fecha	Carga manual
Asunto Mail	Texto	Carga manual
Estado	Selección: Pendiente · Procesado por IA · Autorizado · Error	Carga manual y el flujo
Prioridad IA	Número	El flujo
Analisis IA / Riesgo Detectado	Texto	El flujo
Aprobado	Casilla	La persona que autoriza
Fecha Autorizacion	Fecha	El flujo
Slack TS	Texto	El flujo
Horas hasta Autorizacion	Fórmula	Automática

2.3 Los JSON que viajan entre integraciones

Lo que devuelve la IA. Le pedí que responda únicamente en este formato para poder separarlo con Parse JSON:

```
{
  "prioridad": 5,
  "analisis": "El monto supera el limite mensual del proveedor y la
              factura esta vencida sin reclamo previo.",
  "riesgo": "Monto que supera el límite mensual, factura ya vencida"
}
```

Lo que Make le manda a Notion para actualizar la factura. Cada campo va con su nombre de columna, su tipo y su valor:

```
{
  "page_id": "<id de la fila>",
  "properties": {
    "Prioridad IA": { "number": 5 },
    "Analisis IA": { "rich_text": "... " },
    "Riesgo Detectado": { "rich_text": "... " },
    "Estado": { "select": "Procesado por IA" }
  }
}
```

Lo que devuelve Slack. De todo esto solo me interesa el campo ts, que es el identificador del mensaje. Lo guardo en Notion para después poder responder dentro del mismo hilo:

```
{
  "ok": true,
  "channel": "C0BMWV1KRP1",
  "ts": "1788733163.355349"
}
```

3. Optimización de costos

3.1 Por qué elegí gpt-4o-mini para esta tarea

Clasificar una factura es una tarea corta y con criterios ya definidos. No hay que leer un documento largo ni razonar sobre algo ambiguo: hay que comparar tres números contra tres reglas y devolver un JSON de 150 tokens. Para eso, un modelo grande no aporta nada y cuesta 22 veces más.

Tarea	Modelo elegido	Por qué
Clasificar una factura	gpt-4o-mini	Tarea corta y estructurada. Salida acotada a 250 tokens. Los criterios ya están en el prompt, el modelo no tiene que razonar de cero.
Leer un contrato de obra de 40 páginas	Claude Sonnet	Ventana de contexto amplia y capacidad de leer tablas y gráficos dentro del PDF. Acá sí hace falta el modelo grande.
Auditar 500 contratos al cierre del mes	Claude + Message Batches API	No es urgente, puede esperar 24 horas. El descuento del 50% es automático.
Bloque de criterios que se repite en cada llamada	Prompt Caching	El prefijo no cambia nunca. Se paga entero una vez y después al 10%.

3.2 El cálculo, con números

Sobre un volumen de 500 facturas mensuales, con un prompt de 600 tokens de criterios fijos, 250 tokens de datos variables y 150 tokens de respuesta:

Configuración	Costo mensual	Costo anual	Contra la base
gpt-4o-mini (lo que uso)	USD 0,11	USD 1,30	—
Claude Sonnet 4.5 sin optimizar	USD 2,40	USD 28,80	22 veces más caro
Sonnet + Batch API	USD 1,20	USD 14,40	11 veces más caro
Sonnet + Batch + Prompt Caching	USD 0,80	USD 9,55	7 veces más caro

Tarifas de Anthropic verificadas en su documentación oficial (agosto de 2026). Las de OpenAI son las de lista de gpt-4o-mini: USD 0,15 por millón de tokens de entrada y USD 0,60 de salida.

La conclusión no es que Sonnet sea caro, sino que usarlo acá sería pagar de más por una capacidad que esta tarea no necesita. Elegir el modelo por tarea es lo que hace la diferencia, no apretar los tokens.

3.3 Lo que ya está optimizado en el flujo

- Max Output Tokens en 250. La respuesta es un JSON corto, no hace falta más.
- Temperature en 0. Ante la misma factura, la misma respuesta. Sin creatividad innecesaria.
- Limit del trigger en 3. Procesa de a tandas chicas en lugar de barrer la base entera en cada ciclo.
- Validación antes de la IA. Las facturas incompletas se descartan en el filtro del Router, así que ni siquiera llegan a consumir tokens.

4. Seguridad y resiliencia

4.1 Minimización de datos

La razón social del proveedor está en la tabla Proveedores, pero nunca entra al prompt. A la IA le llega el código interno, el estado comercial, la condición de pago y el límite mensual. Nada más.

Es el mismo criterio de gobernanza que planteé en la Pre-Entrega 1, pero esta vez implementado en la arquitectura y no solo escrito. El nombre real del proveedor no sale de la base de datos.

4.2 Las dos rutas de error

Hay dos, y funcionan en momentos distintos:

Tipo	Cuándo actúa	Qué hace
Preventiva Filtro del Router	Antes de llamar a la IA	Verifica que la factura tenga monto mayor a cero, fecha de vencimiento y proveedor asignado. Si falta algo, la manda a la Ruta 3: se marca como Error, se registra en el log y se avisa por Slack. No se gasta ni una operación de IA.
Reactiva Error Handler sobre OpenAI	Cuando la API falla	Registra el fallo en el Log de Errores y reintenta 3 veces cada 15 minutos. Si después de eso sigue fallando, la ejecución queda guardada en la cola de incompletas y se puede reprocesar sin perder la factura.

4.3 El punto de validación humana

El flujo se detiene después de guardar el análisis y avisar por Slack. En ese momento el análisis existe y se puede leer, pero no se autorizó nada.

La rama de autorización tiene dos condiciones que se tienen que cumplir juntas:

Condición	Operador	Valor	Para qué
Aprobado	Boolean: Equal to	true	Es la aprobación humana. Sin el checkbox tildado, el flujo no avanza.
Estado	Text: Equal to	Procesado por IA	Evita que una factura ya autorizada se vuelva a procesar cada vez que se edita esa fila.

Elegí poner el punto de corte justo antes de autorizar el pago y no antes. La IA hace todo el trabajo de análisis, que es lo tedioso. Lo que no hace es mover plata sin que alguien la mire.

4.4 Por qué el control humano no es opcional acá

Durante las pruebas la IA marcó como riesgo "Proveedor con Estado Comercial distinto de Activo" en una factura de PROV-003, que en la tabla figura como Activo. Los otros dos riesgos que detectó en esa misma factura eran correctos y verificables, pero ese no.

Es exactamente el tipo de error que justifica el HITL. Un modelo puede equivocarse con seguridad, y si el sistema autorizara pagos sin revisión, ese error habría pasado sin que nadie lo note. La persona que aprueba es la que filtra estos casos.

4.5 El check de seguridad de la consigna

Pregunta	Respuesta
¿Hay filtro contra bucles infinitos?	Sí. Cada ruta cambia el Estado al terminar: de Pendiente a Procesado por IA, y de ahí a Autorizado. Como el trigger reacciona a las ediciones y el escenario edita la base, esa re-ejecución no coincide con ningún filtro y el flujo se corta solo.

Pregunta	Respuesta
¿Comparás tipos de datos correctos?	Sí. Monto con operador numérico, Aprobado con operador booleano, Estado con operador de texto. En las pruebas tuve el filtro de Aprobado con operador de texto y no pasaba nunca: el checkbox de Notion viaja como valor lógico, no como la palabra true.
¿El prompt es dinámico?	Sí. Las nueve variables del mensaje vienen mapeadas desde las dos tablas relacionadas. No hay ningún dato fijo.

5. Dashboard de control

Armé una página en Notion con vistas vinculadas de las tablas, para monitorear el sistema sin entrar a Make.

Bloque	Qué responde
Facturas por estado (tablero)	¿Dónde se acumula el trabajo?
Pendientes de autorización, con suma de montos	¿Cuánta plata está esperando una decisión?
Facturas de prioridad 4 o 5	¿Qué hay que mirar hoy?
Riesgos detectados por la IA	¿Qué facturas tienen una observación?
Facturas en estado Error	Tasa de errores del sistema
Promedio de horas hasta autorización	¿Cuánto tarda el cuello de botella humano?
Log de errores	¿Qué falló, cuándo y en qué módulo?

El último es el que más me interesa. Mide el costo del propio control humano: si ese promedio empieza a subir, el punto de aprobación se convirtió en un freno y hay que revisar el proceso. Un panel que mide su propia debilidad sirve más que uno que solo muestra lo que funciona.

8. Lo que aprendí armando esto

La parte que más tiempo me llevó no fue la lógica del flujo sino los tipos de datos. Notion no guarda el texto como una cadena simple: lo guarda como un objeto con formato adentro. Si arrastrás la propiedad entera, en el mensaje te aparece el JSON crudo en vez de la frase. Hay que buscar el hijo Plain text. Me pasó tres veces antes de entenderlo.

Lo mismo con los tipos en los filtros. Un checkbox no se compara con texto, un número no se compara con texto. Parecen detalles hasta que el flujo no avanza y no sabés por qué.

Y una decisión de diseño que tuve que corregir sobre la marcha: la ruta de error estaba armada como fallback puro, sin condiciones, así que atrapaba todo lo que las otras dos rutas no tomaban. El resultado fue que facturas que estaban esperando aprobación terminaban marcadas como Error. Le agregué la condición de que solo actúe sobre facturas en estado Pendiente y se resolvió. Si no lo hubiera visto, el HITL no habría funcionado nunca.
